DISSOLVING THE DYESTUFFS

Stir the dyestuff to a paste with a little cold water, then pour boiling water over the dyestuff, stir vigorously for a few minutes, then add to the dyebath through a fine sieve or cotton cloth. Any undissolved particles of dyestuff are brought into solution by rinsing the filter with hot water.

DYEING METHOD

The colors shown in this card have been selected because of their affinity for weighted silk and generally good properties. Dye in a boiled off soap, Monopole soap or oil, bath with the addition of

di-sodium phosphate Glauber's Salt

and exhaust if necessary with

acetic or formic acid

FASTNESS PROPERTIES

The German method of classification has been followed; when describing fastness to light the numeral 1 is the lowest and 8 the highest degree of fastness. For the other properties 5 is the highest.

These ratings are in comparison with other colors of the same group and have no direct relationship to those of any other class of dyestuffs.

Dischargeability classified as follows:-

- 1. Unchanged, can be used for colored discharges.
- 2. Weaken slightly or change in shade.
- 3. Weaken appreciably and change shade.
- 4. Leave a tint or develop a faint color on standing, can in most cases be used in light and medium shades for discharge whites.
- 5. Discharge pure white.
